

**BIOMASS FOR ELECTRICITY GENERATION**

Through Power Partners, the power sector and the U.S. Department of Energy (DOE) are working together to develop and implement voluntary climate actions to sustain economic growth.

One such voluntary climate action is “Biomass for Electricity Generation.” Biomass for Electricity Generation is a comprehensive effort to widely expand the use of biomass through the support of biomass technologies and develop more efficient ways to combine biomass with coal for electricity generation.

EI member electric companies are working in partnership with U.S. Department of Agriculture and the National Renewable Energy Laboratory, to support this comprehensive effort. The program promotes biomass technologies in their wide variety of forms and focuses on converting waste streams into a useful product. The project aims to make biomass more useful as a boiler feedstock, either on its own or in conjunction with coal as a means of reducing emissions.
