Electric Companies Invest in Resilience

In the face of an increase in wildfires and other extreme weather events, electric companies are uniquely positioned to continue making the investments needed to build more resilient energy systems. By increasing the hardiness of power systems, companies are helping to ensure that the energy grid can effectively and reliably deliver power when needed, especially in the wake of severe storms or unforeseen situations.

Electric companies are pursuing a multi-pronged approach to enhance energy grid resilience. They are

1. **Maximizing Value:** Increasing the structural resilience of power systems.
2. **Forging Partnerships:** Establishing relationships with community partners, local governments, and federal agencies.
3. **Advancing the Conversation:** Discussing resilience strategies and best practices with industry members.
4. **Educating the Public:** Ensuring community members understand the importance of resilience planning.

One of the leading companies in this effort is Georgia Power, which is working on projects as part of its Grid Improvement Plan. The company is collaborating with local and federal leaders to ensure reliable and resilient clean energy can be delivered.
